## ■ Product Characteristics

- **Motion Control Beam(MCB)** suppresses twisting and deformation of the body. This allows the suspensions to perform at their full potential. The MCB also absorbs unpleasant vibration for a more refined riding experience.
- Body roll and pitching is reduced with the MCB. Furthermore, steering response and stability is improved for greater handling during cornering.
- With our expertise in suspension, the most effective mounting position has been tested and verified.
- Includes BLITZ aluminum logo sticker, as well as blue and red sheets. Accent the MCB to match the style of the engine room.

**Please check our website for further information**

## ■ Product Description

•By adding the B-MCB to the space between the engine and radiator, using the radiator support as a mounting point, torsional flex of the member and body is suppressed, allowing the suspension to perform at its full potential.

• Two types are available: 3000N for vehicles with factory suspension and 1000N for vehicles equipped with the DAMPER ZZ-R series.

Users can choose according to the vehicle setup and personal preference.

• For even greater effectiveness when installed together with the front unit, rear versions are also available in 1000N and 3000N specifications.
